IG-Parser Version 0.6 + Production Module for RESILIENT RULES

[Introduction](#)

[Step 1: Verify your Windows Version](#)

[Step 2: Install Git](#)

[Step 3: Install Go \(Golang\)](#)

[Step 4: Clone the GitHub Repository](#)

[Step 5: Run the go build Command](#)

[Step 6: Run the Application](#)

[Step 7: Check for Proper Functioning](#)

[8. Conclusion](#)

Introduction

In this document, you will learn how to install and run a web application developed in Go (Golang) from a GitHub repository. This tutorial is designed for Windows users with no programming experience.

This version, called IG-Parser-Production, includes the IG-Parser v0.6 along with the Excel production module specifically developed for the RESILIENT RULES project.

At the end of the document, potential future developments that could be integrated into the official IG-Parser website will be presented. However, the following application already meets the needs of the RESILIENT RULES project.

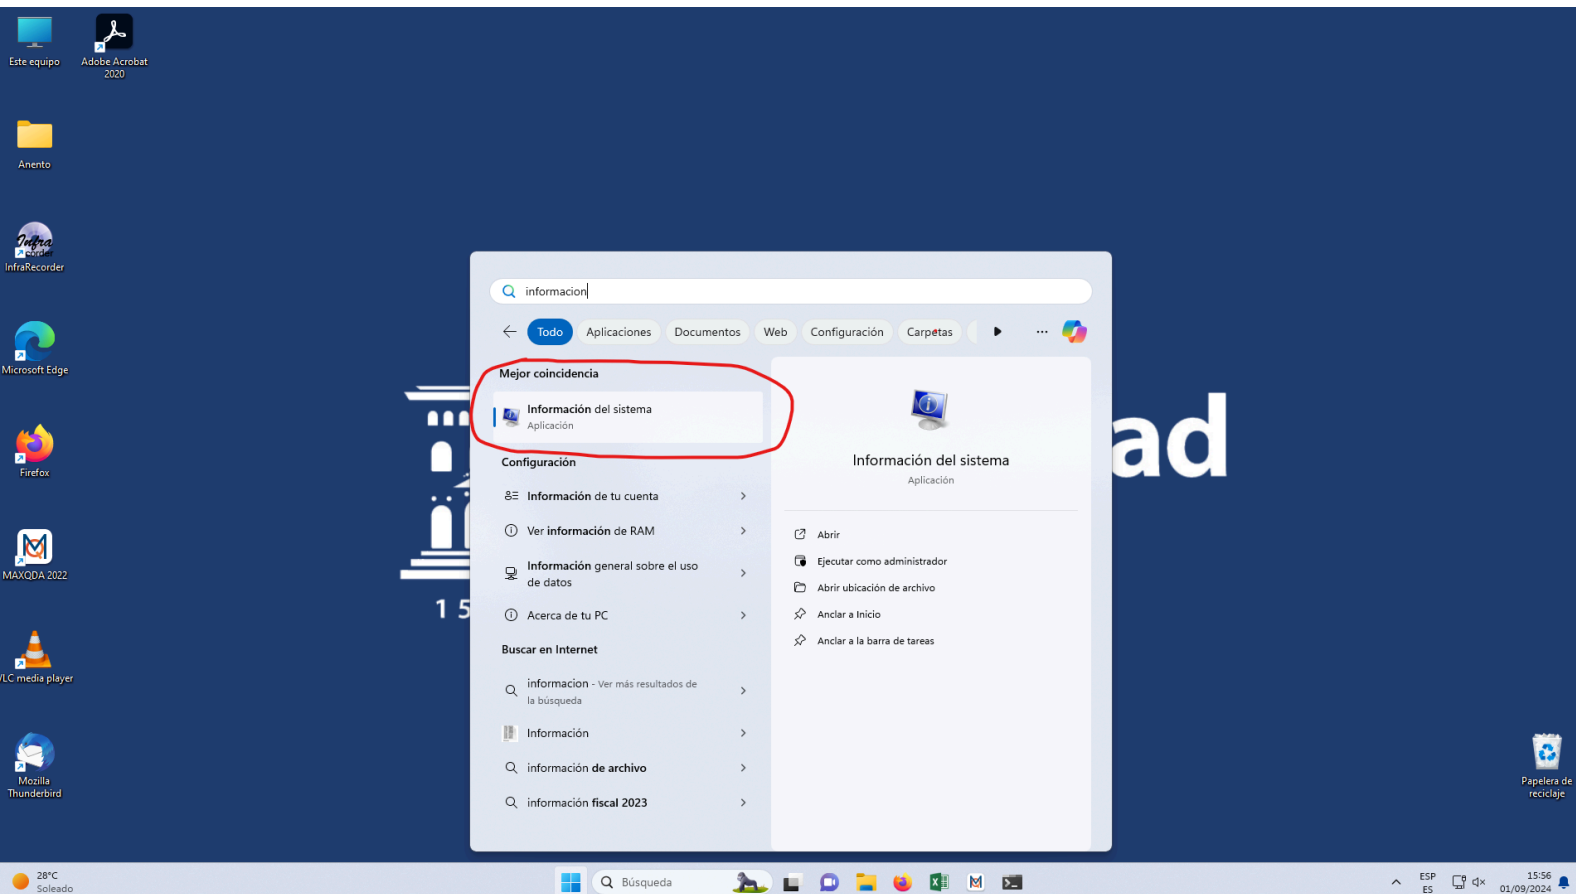

NOTE: This document and the code development are valid as of 02/08/24.

Step 1: Verify your Windows Version

To ensure you download the correct installers, we first need to verify your Windows operating system version.

Instructions:

1. Click on the **Start** button in the bottom bar of your screen.
2. Type “**System Information**” and select the application that appears.

3. In the **System Information** window, look for the following two lines:
- **System Type:** Indicates whether your system is 32-bit or 64-bit.
 - **OS Name:** Shows the version of Windows you are using.

Elemento	Valor
Nombre del SO	Microsoft Windows 11 Education
Versión	10.0.22621 compilación 22621
Descripción adicional del SO	No disponible
Fabricante del SO	Microsoft Corporation
Nombre del sistema	HP-DESK
Fabricante del sistema	HP
Modelo del sistema	HP ProDesk 400 G7 Small Form Factor PC
Tipo de sistema	PC basado en x64
SKU del sistema	9DF60AV
Procesador	Intel(R) Core(TM) i5-10500 CPU @ 3.10GHz, 3096 Mhz, 6 procesadores princi...
Versión y fecha de BIOS	HP S08 Ver. 02.10.00, 11/01/2022
Versión de SMBIOS	3.2
Versión de controladora integr...	9.151
Modo de BIOS	UEFI

Step 2: Install Git

Git is a version control tool that allows you to download (clone) the web application's source code from GitHub.

Instructions:

1. Open your internet browser and go to <https://git-scm.com>
2. Click on the **Download** button. Make sure to select the correct version for your operating system (32-bit or 64-bit).

git --local-branching-on-the-cheap

Git is a [free and open source](#) distributed version control system designed to handle everything from small to very large projects with speed and efficiency.

Git is [easy to learn](#) and has a [tiny footprint with lightning fast performance](#). It outclasses SCM tools like Subversion, CVS, Perforce, and ClearCase with features like [cheap local branching](#), convenient [staging areas](#), and [multiple workflows](#).

Git via Git
If you already have Git installed, you can get the latest development version via Git itself:
`git clone https://github.com/git/git`
You can also always browse the current contents of the git repository using the [web interface](#).

[About this site](#)
Patches, suggestions, and comments are welcome.

Búsqueda

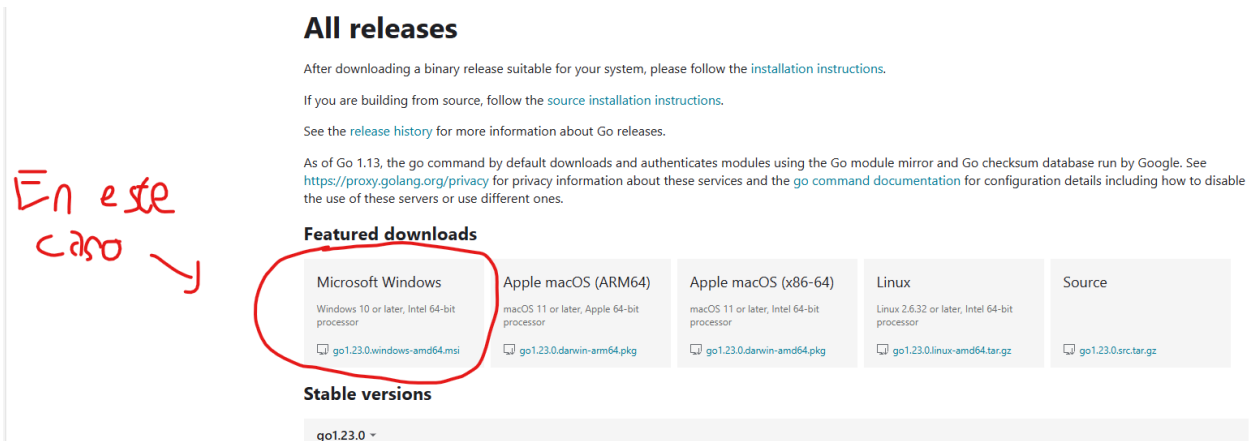

3. Once downloaded, double-click the file to open the installer.
4. Follow the installer instructions. Accept the license terms, leave the default options, and click **Next** until you see the **Install** button.
5. Click **Install** and wait for the installation to complete. A new window may open in your browser with the Git releases; you can close this without any problem.

Step 3: Install Go (Golang)

Go is the programming language used to develop the application. We need to install Go to run the web application.

Instructions:

1. Open your internet browser and go to <https://go.dev/dl/>
2. Select the version of Go that is compatible with your operating system.

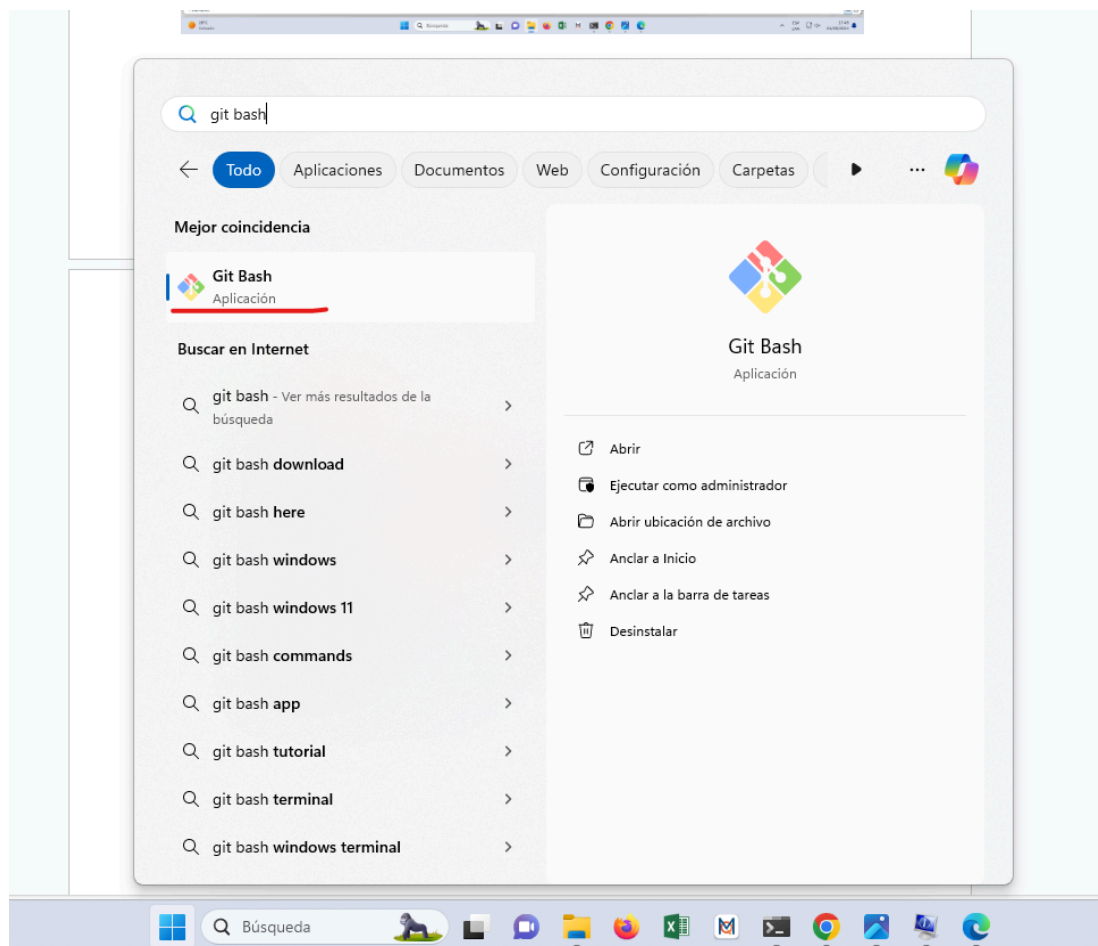

3. Click on the download link.
4. Once downloaded, double-click the file to open the installer.
5. Follow the instructions in the installer to install Go. Accept the license terms, leave the default options, and click **Next** until you see the **Install** button.
6. Click **Install** and wait for the installation to complete.

Step 4: Clone the GitHub Repository

Now we will clone the GitHub repository where the web application is located.

Instructions:

1. Open **Git Bash** (an application installed with Git). You can find it in the Windows Start menu by searching for “**Git Bash**.”

2. In the Git Bash window, type the following command and press Enter:

`git clone https://github.com/ipastore/IG-Parser-Production.git`

```
perezibarra@ipastore MINGW64 ~  
$ git clone https://github.com/ipastore/IG-Parser.git
```

NOTA: Vieja screenshot con antiguo nombre de repositorio (IG-Parser)

3. Wait for the cloning process to complete. This will download the application's source code to your computer.

```
perezibarra@ipastore MINGW64 ~  
$ git clone https://github.com/ipastore/IG-Parser.git  
Cloning into 'IG-Parser'...  
remote: Enumerating objects: 4473, done.  
remote: Counting objects: 100% (787/787), done.  
remote: Compressing objects: 100% (304/304), done.  
remote: Total 4473 (delta 526), reused 717 (delta 476), pack-reused 3686 (from 1)  
Receiving objects: 100% (4473/4473), 4.14 MiB | 5.48 MiB/s, done.  
Resolving deltas: 100% (3072/3072), done.  
  
perezibarra@ipastore MINGW64 ~  
$
```

NOTA: Vieja screenshot con antiguo nombre de repositorio (IG-Parser)

Step 5: Run the go build Command

Once the repository is cloned, we need to compile the code to create the executable file for the web application.

Instructions:

1. Open **Git Bash** again or continue in the same window.
2. Navigate to the folder where the repository was cloned. Type or copy and paste the following command and press Enter:

cd IG-Parser-Production

```

MINGW64:/c/Users/usuario

perezibarra@ipastore MINGW64 ~
$ cd IG-Parser|

```

NOTA: Vieja Screenshot con antiguo nombre de repositorio (IG-Parser)

3. Type or copy and paste the following command and press Enter to compile the application:

go build -o ig-parser.exe ./web

```

perezibarra@ipastore MINGW64 ~/IG-parser (main)
$ go build -o ig-parser.exe ./web

```

4. The .exe file has now been created.

```

MINGW64:/c/Users/usuario/IG-Parser

perezibarra@ipastore MINGW64 ~
$ cd IG-Parser

perezibarra@ipastore MINGW64 ~/IG-Parser (main)
$ go build -o ig-parser.exe ./web
go: downloading github.com/xuri/excelize/v2 v2.8.0
go: downloading golang.org/x/text v0.12.0
go: downloading github.com/xuri/nfp v0.0.0-20230819163627-dc951e3ffe1a

perezibarra@ipastore MINGW64 ~/IG-Parser (main)
$

```

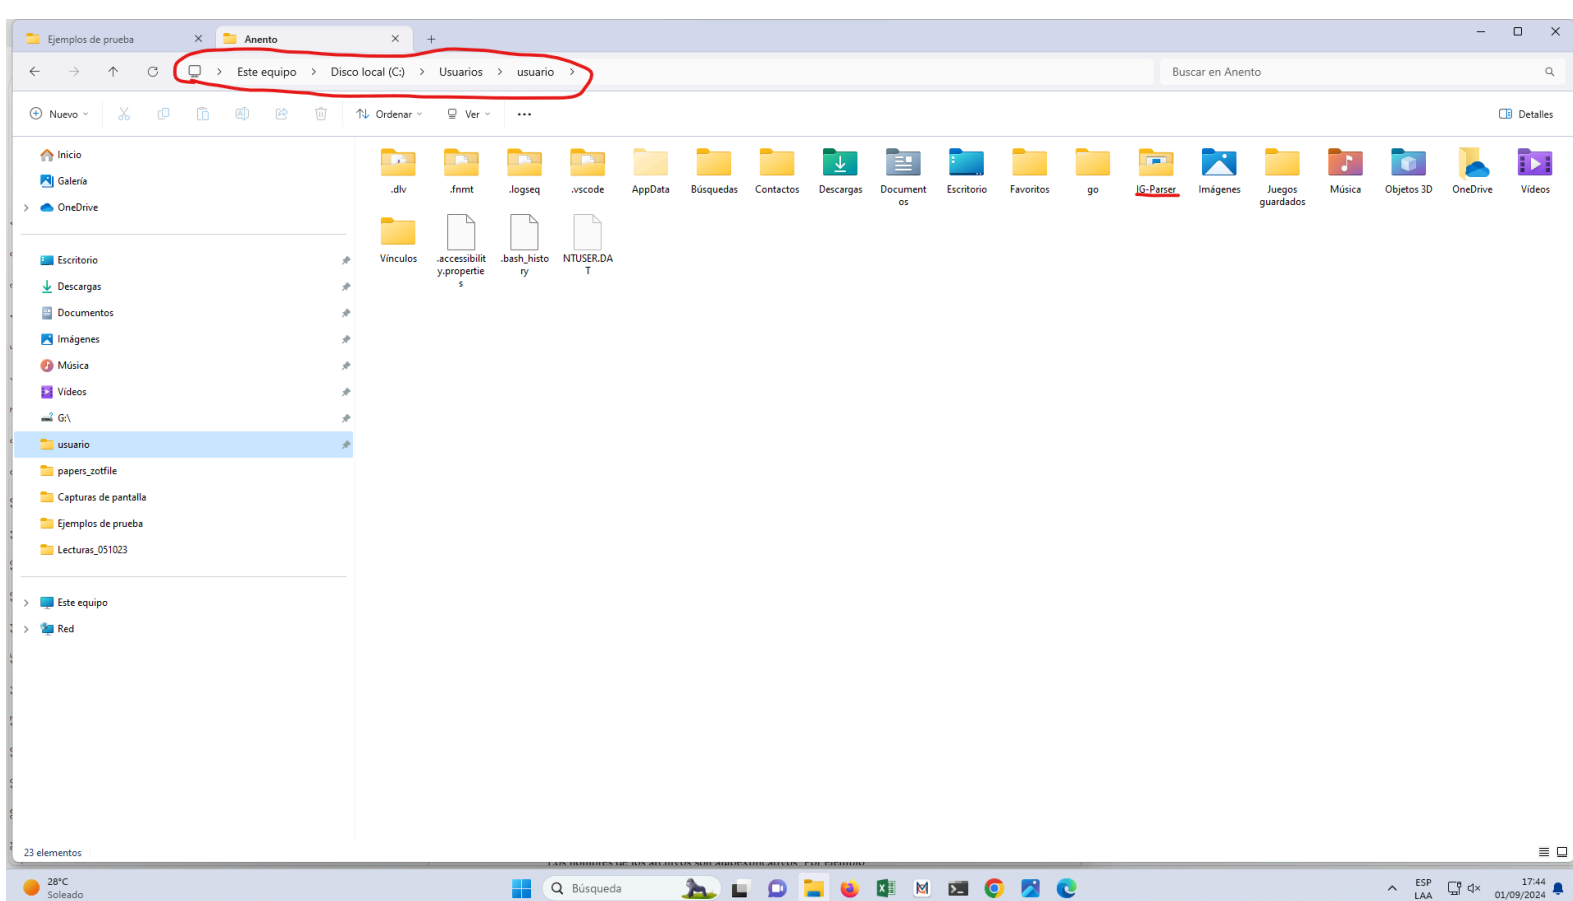

NOTA: Vieja Screenshot con antiguo nombre de repositorio (IG-Parser)

Step 6: Run the Application

After compiling the application, we can run it.

Instructions:

1. Navigate to the **IG-Parser-Production** folder. This can be found inside your user folder (This PC → Local Disk (C:) → Users → [your username]).

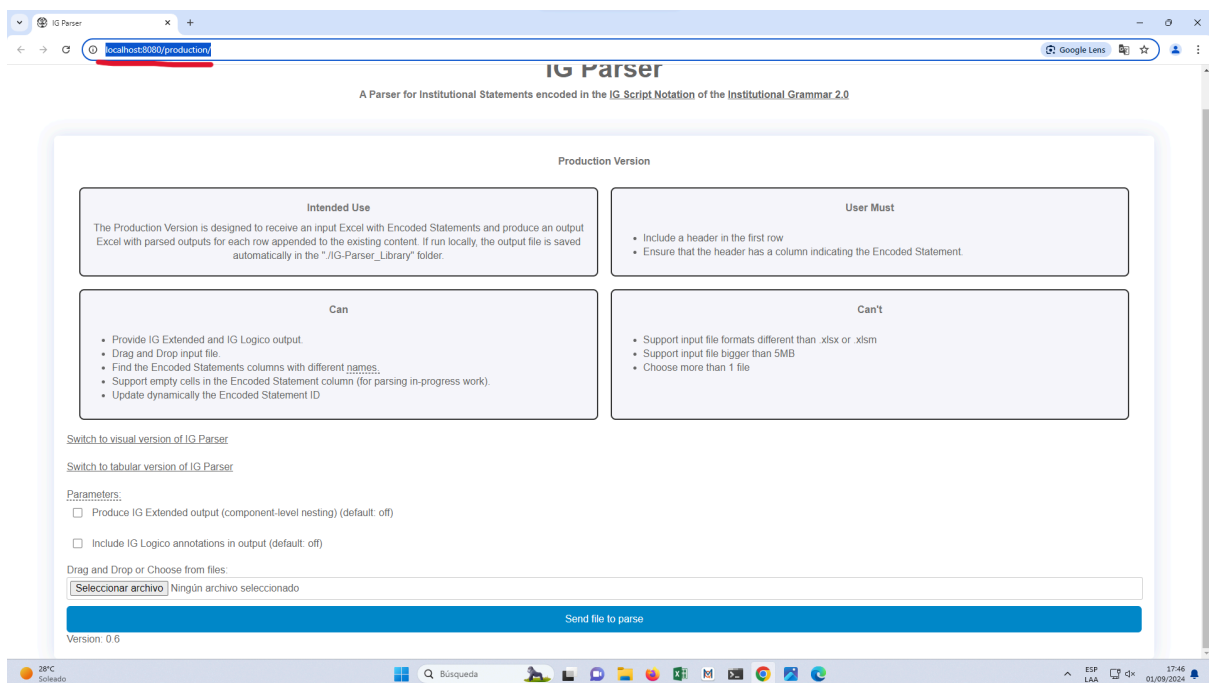

NOTA: Vieja Screenshot con antiguo nombre de carpeta (IG-Parser)

2. Find the **ig-parser.exe** file and double-click it.

NOTA: el archivo aparece bajo el Nombre "ig-parser" y Tipo "Aplicación".

3. The application will automatically start in a new window of your default browser at the URL: <http://localhost:8080/production/>.

A new terminal window will also open, which you don't need to use or understand. The terminal contains the engine, and the browser window is the user interface.

NOTE: Please note that if you close this window, you will close the engine and you will not be able to use the browser view. If you want to reopen it, go back to point 2 (double click on ig-parser.exe)

```

) Bdir(compliance)

```

Step 7: Check for Proper Functioning

The application is now ready to use. We will now choose one of the example files available on the Drive to test its proper functioning.

Instructions:

1. Go to the **IG-Parser-Production** folder on your computer (This PC → Local Disk (C:) → Users → [your username] → IG-Parser-Production) and find the folder named **“excel-examples-for-production.”**
2. A new folder will open containing files with different characteristics. The file names are self-explanatory. For example, **“102_TestProductionRowLargerThanHeader.xlsx”** contains an Excel file with a row longer than the header, which returns an error in the program.

- Use an easy example to start: **“01_TestProductionWithoutParsingError.xlsx.”**
This file does not contain any errors and will produce a successfully processed file.
- You can select the file using the **“Select file”** button or drag and drop the file directly to the **“No file chosen”** area (this last function does not work in Microsoft Edge; it has only been tested in Google Chrome).

Parameters:

- ☐ Produce IG Extended output (component-level nesting) (default: off)
- ☐ Include IG Logico annotations in output (default: off)

Drag and Drop or Choose from files:

Seleccionar archivo Ningún archivo seleccionado

Send file to parse

Version: 0.6

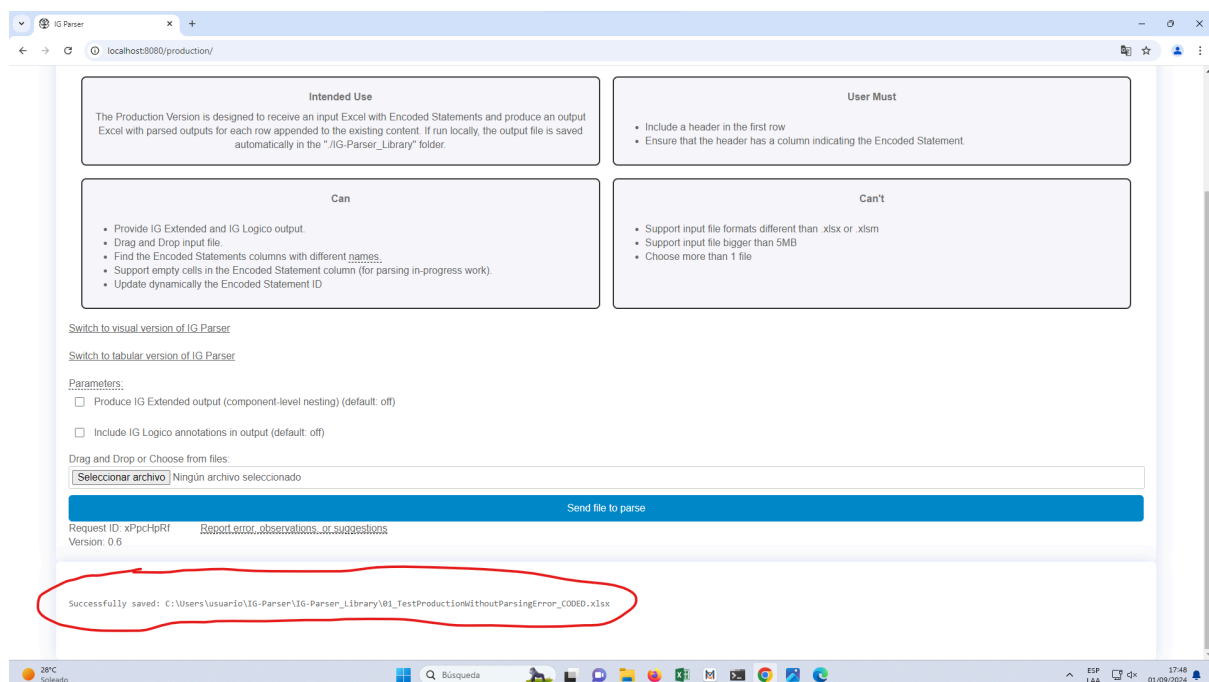

5. If the file name appears in gray, it means you have selected it correctly. Click **“Send file to parse.”**

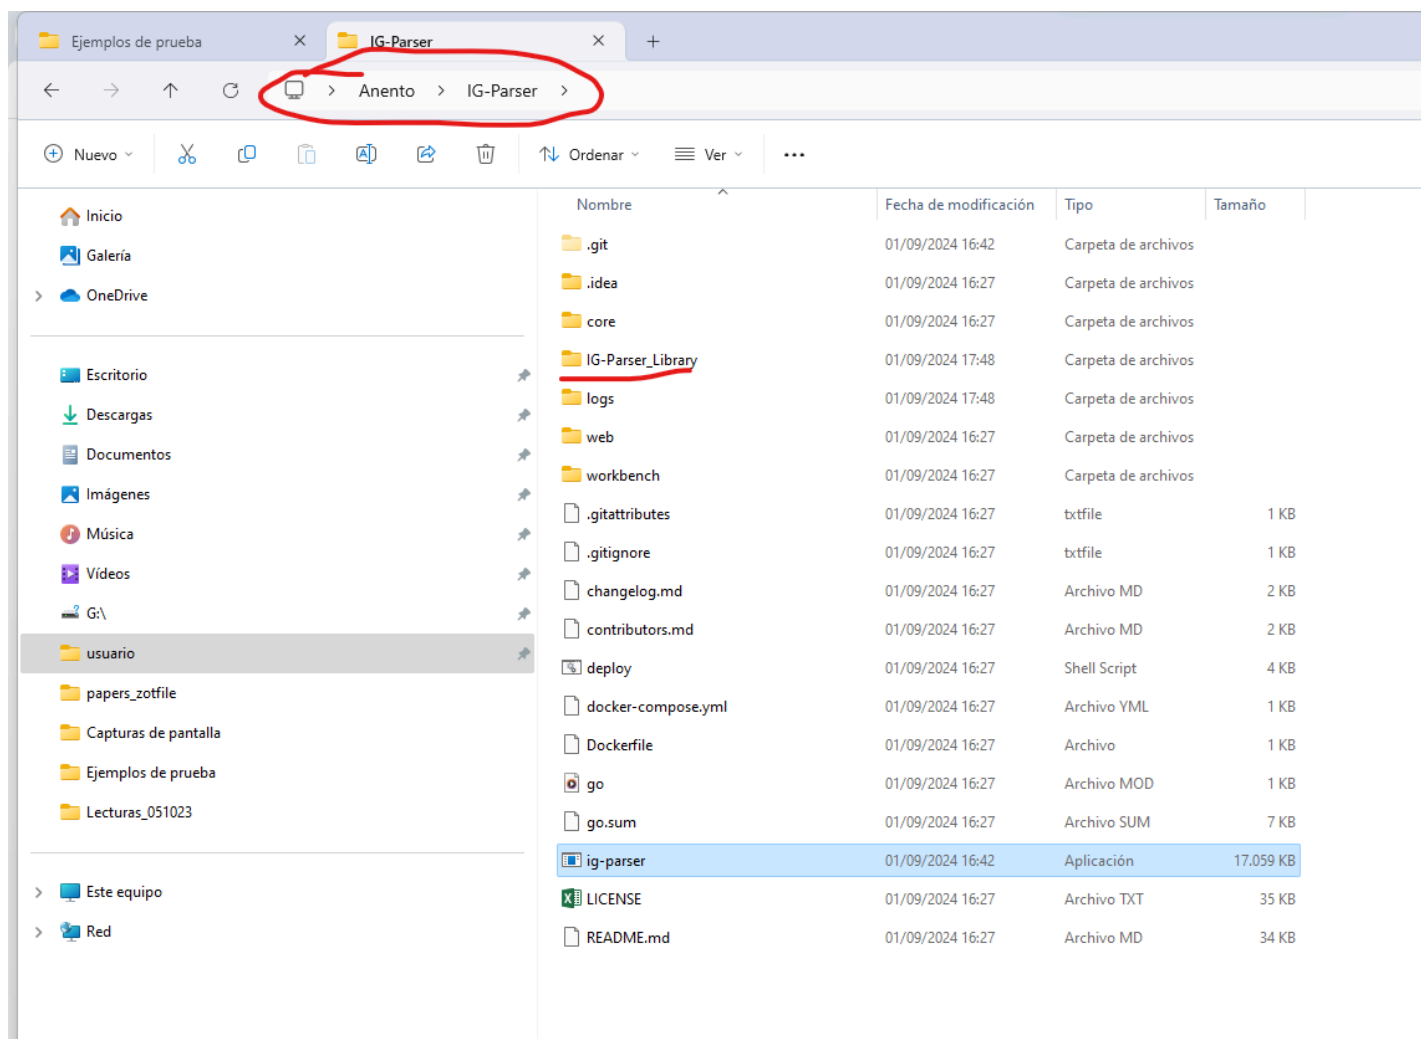

6. If there is any error, a red message will appear. Otherwise, a message will appear:

“Succesfully saved in “_____”

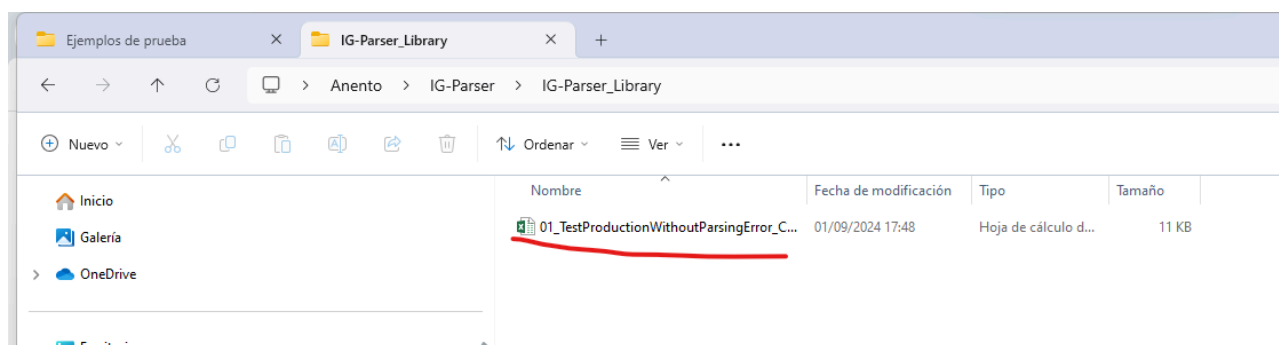

(This is the location of the processed file).

7. By default, the program saves processed files in a folder called **“IG-Parser_Library”** inside the **“IG-Parser”** folder. The output file name is the original name followed by **“_CODED.”** For example, **“01_TestProductionWithoutParsingError_CODED.”**

Nota: Vieja Screenshot con antiguo nombre de carpeta (IG-Parser)

Nota: Vieja Screenshot con antiguo nombre de carpeta (IG-Parser)

8. Conclusion

Congratulations, you have successfully installed and run IG-Parser-Production (IG-Parser v0.6). You can continue testing the example files to see potential errors and the application's capabilities. You can also try the **"IG-Extended"** and **"IG-Logico"** options and note the differences in encoding.

On the other hand, the Tabular and Visual Output functions are functional and can be used to code each statement.

Future Functionalities:

- **Automatic Statement ID Generation Chosen by User:** Choose Excel columns to generate a Statement ID automatically (e.g., select “Document Name,” “Code,” “Principle,” and “End” to produce an ID: “199_CHO_5_5”).
- **Symbol Display in Headers:** Option to display full names or symbols in headers (e.g., “Direct Object” or “Bdir”).
- **Enhanced Sheet Coding:** Expand the code to encode all Sheets containing an Encoded Statement column, potentially through the UI with user-provided information.

9. Update or Uninstallation

If the source code is updated after you have completed an installation, you may want to update to the latest version. To do this, you need to first uninstall and then reinstall the application.

Instructions:

1. Simply delete the “IG-Parser-Production” folder (This PC → Local Disk (C:) → Users → [your username] → IG-Parser-Production).
2. Reapply Step 4 and Step 5 (Clone the Repository and Run the Go Build Command).

NOTE: If you only want to uninstall, simply follow Instruction 1 (Delete the folder).
